

Maksim Omelchenko

Senior Android Engineer • Platform / Architecture / Performance

Kotlin • Jetpack Compose • Multi-module (160+ modules) • Dagger 2 + KSP • Performance • Fintech

maksim.vyacheslavovich.o@gmail.com • github.com/OmelchenkoMaksim

WhatsApp: +7 989 633 4901 (messages) • Telegram: [@ric_i_am](https://t.me/ric_i_am)

Relocation: Munich, Germany (currently Moscow) • EU Blue Card eligible (IT shortage occupation) • visa sponsorship required

PROFILE

Android engineer with 6+ years of commercial development — **all of it in fintech**: Sberbank and VTB (embedded in the banks' product teams), then MTS Bank, where I grew from middle to lead engineer with a Staff-level scope. I work at **platform scope**: I build internal tooling and standards that speed up 20+ engineers, drive cross-cutting migrations (DI, navigation, XML → Compose), and optimize a large multi-module app — 160+ feature modules, 4M+ installs. I moved into development from QA automation (2.5 years, Java + Selenium), so quality is an engineering habit: my features ship with zero production crashes and minimal bugs. I do my best work on high-leverage problems: complex legacy, developer productivity, and performance engineering.

KEY ACHIEVEMENTS

- Designed and shipped an **MVI feature-generator plugin** for Android Studio (IntelliJ Platform): a new feature module following the company-wide standard (MVI + presentation + DI) is scaffolded in **~2 minutes instead of ~1 working day**; adopted by **all 20+ Android engineers across 10+ teams**.
- Substantially **improved cold start and UI smoothness** of an app with 4M+ installs: removed `runBlocking` from the hottest path (feature toggles → synchronous $O(1)$ reads), added background pre-warming of the `WebView`, `Compose` runtime and `TabBar`, staged startup, and frame-by-frame rendering of heavy content.
- Sole owner of the Sales & Personalization domain — 28 modules**; sales functionality is embedded in almost every product flow of the app.
- On my own initiative, **removed the legacy navigation stack** no one dared to touch and migrated the entire project (160+ modules) to the new navigation architecture.
- Drove a project-wide **dependency injection refactoring**; earlier, migrated from a service locator to `Dagger 2`: better stability, **build time cut from 17 to 12 minutes**, with further gains via build-logic convention plugins.

SKILLS & STACK

Languages: Kotlin (6 yrs), Java (8 yrs)

UI: Jetpack Compose, XML/View, XML → Compose migrations, in-house design system / UI kit, Lottie, Coil/Glide

Architecture: multi-module api/impl (160+ modules), Clean Architecture, MVI/MVVM/MVP, Gradle convention plugins (build-logic), extracting modules into standalone library repositories

DI & Concurrency: `Dagger 2` + `KSP`, `Hilt`, `Koin`; `Coroutines`, `Flow`, `RxJava`, `WorkManager`

Network & Data: `Retrofit`, `Room`, `Realm`, `Firestore`, feature toggles (CMS), deep links

Performance: cold-start optimization, jank elimination, background subsystem pre-warming, `MainThreadWatchdog`, frame-by-frame rendering, main-thread profiling

Quality & CI: `JUnit`, `MockK`, `Mockito`; `Detekt` + baseline, custom lint rules, `SonarQube`, `Jenkins`, `Fastlane`; QA background: `Selenium WebDriver` (Java)

Distribution & Tools: Google Play (GMS), Huawei AppGallery, RuStore; `GitLab`, `Bitbucket`, `Jira`, `Postman`, `Charles`; `KMP` (prototypes)

EXPERIENCE

Lead Android Engineer — MTS Bank (MTS Money) *Apr 2023 – present • remote*

Digital bank of MTS Group, Russia's largest telecom operator. Flagship banking app: 160+ feature modules with api/impl isolation, Google/Huawei flavors, 4M+ downloads and a 4.8 rating (290k reviews) on RuStore, Russia's primary Android app store. Main repository: 28 teams, 30+ Android engineers — one of dozens of repos. Path: Platform team → Benefits → Sales & Personalization; joined as a middle engineer, promoted to lead (Staff-level scope).

- MVI feature generator** (Android Studio / IntelliJ Platform plugin) — my first task on the Platform team: scaffolds a standards-compliant module in a couple of clicks instead of ~1 day; de-facto standard for 20+ engineers across 10+ teams.

- **Cold start & smoothness optimization:** eliminated main-thread blocking, moved heavy work to IO dispatchers, background pre-warming of heavy subsystems, staged startup; built a two-phase MainThreadWatchdog (debug-only) that surfaced every bottleneck.
- Removed the “untouchable” **legacy navigation** entirely (own initiative) and migrated the whole project to the new navigation architecture.
- Project-wide **dependency injection refactoring**; earlier, migration from a service locator to Dagger 2: improved stability, build time 17 → 12 min, further speed-ups via build-logic convention plugins.
- **Sole ownership of the Sales & Personalization domain** (28 modules), embedded in nearly every section of the app; I align requirements, design and documentation changes with analysts at the feature-definition stage.
- Refactored the app core (App, MainActivity modules), extended the deep-link module, introduced an **A/B testing** mechanism; migrated screens from XML to Jetpack Compose; extracted modules into separate repositories for cross-project reuse.
- Onboard Android engineers from other teams and take part in hiring. Releases every 2 weeks; **zero production crashes** from my features and minimal bugs.

Android Developer — Andersen / Aston — outstaffed to Sberbank and VTB Aug 2020 – Apr 2023 · remote

Worked inside the product teams of two of Russia's largest banks on the vendor side; grew from junior to middle engineer.

- VTB: built **insurance** functionality in the bank's mobile app.
- Sberbank: enhanced app functionality related to BDD scenarios.
- Stack: MVVM/MVP/MVI, Hilt/Dagger 2, Coroutines/Flow/RxJava, Room/Realm/Firebase, WorkManager, Data/View Binding.

QA Automation Engineer (Java) — a1qa Jan 2018 – Jul 2020 · remote · part-time

First commercial coding role; part-time in parallel with rotation-based work at Polyus.

- UI test automation and functional testing with Selenium WebDriver (Java); test cases from business requirements, bug tracking in Jira, close collaboration with developers and product managers.

System Administrator — Polyus (Russia's largest gold producer) Mar 2017 – Jul 2020 · fly-in/fly-out rotation, Yakutia

- IT infrastructure support and monitoring, network security, tech support, documentation.

MENTORING & TEACHING

Tutor, “Android Developer” program — Yandex Practicum Nov 2022 – Dec 2023 · remote · part-time

- Supervised student cohorts: webinars, individual and group sessions, code reviews and deep dives into complex topics; consistently high ratings from students and the team (certificate issued by Yandex Practicum).

EDUCATION

Rostov State University of Civil Engineering — Specialist Degree in Engineering (5-year program) · 2008–2013

LANGUAGES & CERTIFICATES

Languages: English — C1 Advanced (EF SET certificate); Russian — native

Certificates: EF SET English Certificate (C1); Tutor certificate, Yandex Practicum (“Android Developer” program)
